$\tilde{Q}_1 = \text{Datenwert d.d. Stelle } 0,25 \cdot N = 20 \cdot 0,25$
 $= 5$

$$\bar{x} = \frac{1}{N} \sum_{i=1}^N x_i = \frac{1}{20} \cdot \sum_{i=1}^{20} x_i = 14,22$$

$$s^2 = \frac{1}{N-1} \sum_{i=1}^N (x_i - \bar{x})^2$$

$$s^2 = \frac{1}{19} \sum_{i=1}^{20} (x_i - 14,22)^2 = 13,367 \rightarrow \text{Excel}$$

$\tilde{Q}_1 = [0,75 \cdot N] = 15$ $\tilde{Q}_A := 15 - 3,2 = 11,8$

Verteilung ähnelt der Exponentialverteilung (typisch für Lebensdauer)

⑥ Maximum - Likelihood - Schätzer

$$f(x, \mu, \sigma) = \frac{1}{\sqrt{2\pi}\sigma} e^{-\frac{1}{2}\left(\frac{x-\mu}{\sigma}\right)^2}$$

$$L(\Theta) = \prod_{i=1}^N f(x_i, \mu, \sigma) = \left(\frac{1}{\sqrt{2\pi}\sigma}\right)^N e^{-\frac{1}{2}\sum_{i=1}^N \left(\frac{x_i-\mu}{\sigma}\right)^2}$$

1. Bestimmen der Maximum Likelihood Funktion: $L(\mu, \sigma) = \prod_{i=1}^n \frac{1}{\sqrt{2\pi}\sigma} e^{-\frac{1}{2}\left(\frac{x_i-\mu}{\sigma}\right)^2}$

2. Logarithmierung: $\ln(L(\Theta)) = \sum_{i=1}^n \ln\left(\frac{1}{\sqrt{2\pi}\sigma} e^{-\frac{1}{2}\left(\frac{x_i-\mu}{\sigma}\right)^2}\right)$

$$= \sum_{i=1}^n \left(\ln \frac{1}{\sqrt{2\pi}\sigma} - \frac{1}{2} \left(\frac{x_i - \mu}{\sigma} \right)^2 \right) = \sum_{i=1}^n \left(\ln(1) - \ln(\sqrt{2\pi}\sigma) - \frac{1}{2} \left(\frac{x_i - \mu}{\sigma} \right)^2 \right)$$

$$= \sum_{i=1}^n \left(-\ln \sqrt{2\pi} - \ln \sigma - \frac{1}{2} \left(\frac{x_i - \mu}{\sigma} \right)^2 \right)$$

3. partielle Ableitungen bestimmen

$$\frac{d}{d\mu} \left(\sum_{i=1}^n \left(-\ln \sqrt{2\pi} - \ln \sigma - \frac{(x_i - \mu)^2}{2\sigma^2} \right) \right)$$

$$= \sum_{i=1}^n \left(-2 \cdot (x_i - \mu) \cdot (-1) \cdot \frac{1}{2\sigma^2} \right) = \sum_{i=1}^n \left(\frac{x_i - \mu}{\sigma^2} \right) = \textcircled{\text{I}}$$

$$\frac{d}{d\sigma} \left(\sum_{i=1}^n \left(-\ln \sqrt{2\pi} - \ln \sigma - \frac{(x_i - \mu)^2}{2\sigma^2} \right) \right) = \sum_{i=1}^n \left(-\frac{1}{\sigma} - (-2) \cdot \frac{(x_i - \mu)^2}{\sigma^3} \right)$$

$$= \sum_{i=1}^n \left(-\frac{1}{\sigma} + \frac{(x_i - \mu)^2}{\sigma^3} \right) = \textcircled{\text{II}} \quad \left(-\frac{1}{\sigma} + \right)$$

4. Ableitungen null setzen

$$\textcircled{\text{I}} \quad \sum_{i=1}^n \left(\frac{x_i - \mu}{\sigma^2} \right) = 0$$

$$\sum_{i=1}^n (x_i - \mu) = 0$$

$$\sum_{i=1}^n x_i = n \cdot \mu$$

$$\frac{1}{n} \sum_{i=1}^n x_i = \underline{\underline{\mu = \bar{x}}}$$

$$\textcircled{\text{II}} \quad \sum_{i=1}^n \left(-\frac{1}{\sigma} + \frac{(x_i - \mu)^2}{\sigma^3} \right) = 0$$

$$\sum_{i=1}^n \left(\frac{(x_i - \mu)^2}{\sigma^3} \right) = \frac{n}{\sigma}$$

$$\frac{n}{\sigma^3} \cdot \sum_{i=1}^n (x_i - \mu)^2 = \frac{n}{\sigma}$$

$$\sum_{i=1}^n (x_i - \mu)^2 = \sigma^2 \cdot n$$

$$\sqrt{\frac{1}{n} \sum_{i=1}^n (x_i - \mu)^2} = \sigma$$

$$\mu = \bar{x} \rightarrow \sqrt{\frac{1}{n} \sum_{i=1}^n (x_i - \bar{x})^2} = \sigma$$

$$\textcircled{7} \quad Y = \frac{1}{n} \sum_{i=1}^n x_i \quad x_i \sim \mathcal{N}(\mu, \sigma^2)$$

$$E[Y] = E\left[\frac{1}{n} \sum_{i=1}^n x_i\right] = \frac{1}{n} E\left[\sum_{i=1}^n x_i\right] = \frac{1}{n} \sum_{i=1}^n E[x_i] = \frac{1}{n} \sum_{i=1}^n \mu = \mu \cdot n \cdot \frac{1}{n} = \mu$$

$$\text{Var}[Y] = \text{Var}\left[\frac{1}{n} \sum_{i=1}^n x_i\right] = \frac{1}{n^2} \sum_{i=1}^n \text{Var}[x_i] = \sigma^2 \cdot n \cdot \frac{1}{n^2} = \frac{\sigma^2}{n}$$

$$Y \sim \mathcal{N}\left(\mu, \frac{\sigma^2}{n}\right) \quad n \rightarrow \infty \quad \mathcal{N}(\mu, 0) \quad (\text{Varianz geht gegen null})$$

$n \rightarrow \infty$: σ geht gegen 0, d.h. Wert wird stabil: $\bar{x} = \mu$
