

Assuming, the bike is locked to an immobilizable object like a fence or pole, locked with code lock 4 digits, assuming 2 Code possibilities checked per second

$$\frac{5000}{2s^{-1}} = 2500s \Rightarrow \text{time for mean brute force with 10 000 possibilities}$$

1min work costs 20€ (is cause of risk so expensive)
 ↳ maybe cost should increase exponentially over time?

Assuming, the bike is locked to an immobilizable object like a fence or pole, locked with cheap key lock. Lock picker knows lock and tested one of this kind beforehand.

1min work costs 20€ (is cause of risk so expensive)
↳ maybe cost should increase exponentially over time?
